1. General Description

The ALC269 version C (ALC269-VC) is a enhanced version of High Definition Audio Codec that integrates 4-channel DAC, 4-channel ADC, and a stereo Class-D Speaker Amplifier with per channel 2 Watt RMS output power. The major improvements compared with previous series of ALC269 are ALC269-VC has lower power consumption Codec, and Class-D speaker amplifier has good THD+N performance.

The 4-channel DAC supports two independent stereo or 2.1 channels sound outputs, 4-channel ADC integrates two stereo and independent analog sound inputs (multiple streaming). Incorporating Realtek converter technology to achieve 95dB dynamic range playback quality and over 90dB dynamic range recording quality, it meets Microsoft® WLP (Windows Logo Program) audio requirements for Windows Vista and Windows 7 systems.

ALC269-VC has two stereo analog microphone input and one stereo digital microphone input, with Realtek proprietary software Acoustic Echo Cancellation (AEC), Beam Forming (BF), and Noise Suppression (NS) technologies, significantly improving voice quality for PC VoIP applications.

As well as basic audio functions, ALC269-VC supports one S/PDIF output converter to connect a PC to consumer electronic products such as digital decoders and speakers.

There are total three amplifiers integrated in ALC269-VC. A linear headphone amplifier at port-C, and a headphone amplifier at port-A without the need of external DC blocking capacitors, eliminating pop noise caused by DC locking capacitors. The third is an integrated stereo Class-D amplifier to directly drive speakers without extra L-C filters. The Class-D amplifier is designed to drive speakers with as low as 4Ω impedance. Its maximum output power is 2.2Watt (rms) per channel at 5V power supply.

To prevent mini speakers have various impedance and power tolerance burn out while playing low frequency sound, ALC269-VC integrates a high pass filter with programmable cut off frequency between 10Hz and 900Hz and limits output power from 45% to 100%. Additions to speaker protection, ALC269-VC has thermal detect and protection to avoid over-heating, also over-current protection to prevent output externally short to power, ground or terminates. All these protection circuits are integrated without extra component needed.

2. Features

2.1. Hardware Features

- Meets Microsoft® WLP (Windows Logo Program) and Lync™ audio requirements for Windows Vista and Windows 7 system
- 95dB Signal-to-Noise Ratio (A-weighting) for DAC output
- 90dB Signal-to-Noise Ratio (A-weighting) for ADC input
- 4-channel DAC supports 16/20/24-bit PCM format for independent two stereo channel or 2.1 audio playback
- 4-channel ADC supports 16/20/24-bit PCM format for independent two stereo channel audio inputs
- All DACs support 44.1k/48k/96k/192kHz sample rate
- All ADCs support 44.1k/48k/96k/192kHz sample rate
- SPDIF-OUT support 16/20/24-bit format and 32/44.1/48/88.2/96/192kHz rate
- Support MONO line level output
- Analog port-B(MIC1), port-F(MIC2), port-C(LINE1) and port-E(LINE2) support input and output re-tasking
- Support external PCBEEP input and built-in digital BEEP generator
- Software selectable 2.5V/3.2V/4.0V VREFOUT as bias voltage for analog microphone input
- Programmable +10/+20/+30dB boost gain for analog microphone input
- Support stereo digital microphone input, and programmable boost gain and volume control
- Built-in headphone amplifiers for port-C (LINE1) and port-A (HP OUT)
- Headphone amplifier for port-A does not require DC blocking capacitors
- Two jack detection pins each designed to detect up to 4 jacks, and SPDIF-OUT jack detection is supported
- Support combo jack with stereo headphone output and mono microphone input on a 4-pole jack
- Combo jack detection without extra MOSFET needed
- 2 GPIOs for customized applications (pin shared with digital microphone interface)

- Supports Anti-pop mode when analog power AVDD is on and digital power is off
- Support PCBEEP pass-through to Class D output (Port D)
- Volume synchronization for PCBEEP in D0/D3 mode change
- PCBEEP input signal level detection
- Enhanced power management features for normal operation and standby mode
- Stereo Bridge-Tied Load Class-D amplifier at port-D has 2Watt (rms)/4Ω per channel output
- Short circuit and thermal overload protection for Class-D amplifier
- Class D amplifier has high pass filter with programmable Cut-Off frequency (10Hz~900Hz) to protect mini speaker
- Class D amplifier output with slew rate and spread spectrum control to improve EMI performance
- Intel low power ECR compliant, supports power status control, jack detection, and wake-up event in D3 mode
- 3.3V digital core power, 1.5V~3.3V digital IO power for HDA link; 4.75V~5.5V analog power for Codec, 4.75V~5.5V power stage voltage for Class D amplifier
- Built in a 5V-to-4.5V linear regulator with 60dB PSRR to power analog circuitry.
- 48-pin MQFN 'Green' package (**6x6 mm** dimension)

2.2. Software Features

- Compatible with Windows Logo Program 3.1x requirements
- EAX™ 1.0 & 2.0 compatible
- Direct Sound 3D™ compatible
- I3DL2 compatible
- HRTF 3D Positional Audio (Windows XP only)
- Emulation of 26 sound environments to enhance gaming experience
- Multi-band software equalizer and tools

- Voice Cancellation and Key Shifting in Karaoke mode
- Dynamic range control (expander, compressor, and limiter) with adjustable parameters
- Intuitive Configuration Panel (Realtek Audio Manager) to enhance user experience
- Realtek proprietary Microphone Acoustic Echo Cancellation (AEC), Noise Suppression (NS), and 2nd generation of Beam Forming (BF) technology for voice application
- Smart multiple streaming operation
- HDMI audio driver for AMD platform
- Optional Dolby PCEE program, SRS TruSurround HD, SRS Premium Sound, Fortemedia SAM, Creative Host Audio, Synopsys Sonic Focus, DTS Surround Sensation | UltraPC, and DTS Connect licenses

3. System Applications

- Multimedia desktop and laptop PCs
- Netbook and tablet device with High Definition Audio Controller

7. High Definition Audio Link Protocol

7.1. Link Signals

The High Definition Audio (HDA) Link is the digital serial interface that connects the HDA codecs to the HDA Controller. The HDA link protocol is controller synchronous, based on a 24.0MHz BIT-CLK sent by the HDA controller. The input and output streams, including command and PCM data, are isochronous with a 48kHz frame rate. Figure 5 shows the basic concept of the HDA link protocol.

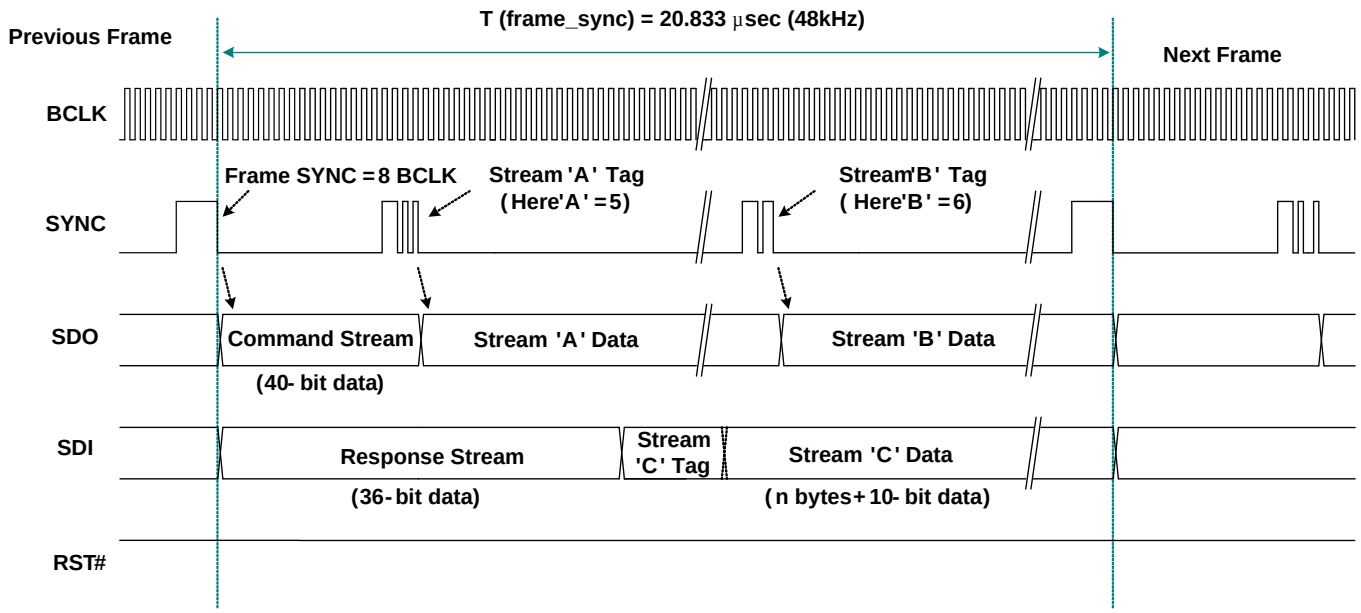

Figure 5. HDA Link Protocol

7.1.1. Signal Definitions

Table 5. Link Signal Definitions

Item	Description
BCLK	24.0MHz bit clock sourced from the HDA controller and connected to all codecs.
SYNC	48kHz signal used to synchronize input and output streams on the link. It is sourced from the HDA controller and connects to all codecs.
SDO	Serial Data Output signal driven by the HDA controller to all codecs. Commands and data streams are carried on SDO. The data rate is double pumped; the controller drives data onto the SDO, the codec samples data present on SDO with respect to each edge of BCLK. The HDA controller must support at least one SDO. To extend outbound bandwidth, multiple SDOs may be supported.
SDI	Serial Data Input signal driven by the codec. It is point-to-point serial data from the codec to the HDA controller. The controller must support at least one SDI, and up to a maximum of 15 SDI's can be supported. SDI is driven by the codec at each rising edge of BCLK, and sampled by the controller at each rising edge of BCLK. SDI can be driven by the controller to initialize the codec's ID.
RST#	Active low reset signal. Asserted to reset the codec to default power on state. RST# is sourced from the HDA controller and connects to all codecs.

Table 6. HDA Signal Definitions

Signal Name	Source	Controller Type	Description
BCLK	Controller	Output	Global 24.0MHz Bit Clock.
SYNC	Controller	Output	Global 48kHz Frame Sync and outbound tag signal.
SDO	Controller	Output	Serial Data Output from Controller.
SDI	Codec/Controller	Input/Output	Serial Data Input from codec. Weakly pulled down by the controller.
RST#	Controller	Output	Global Active Low Reset Signal.

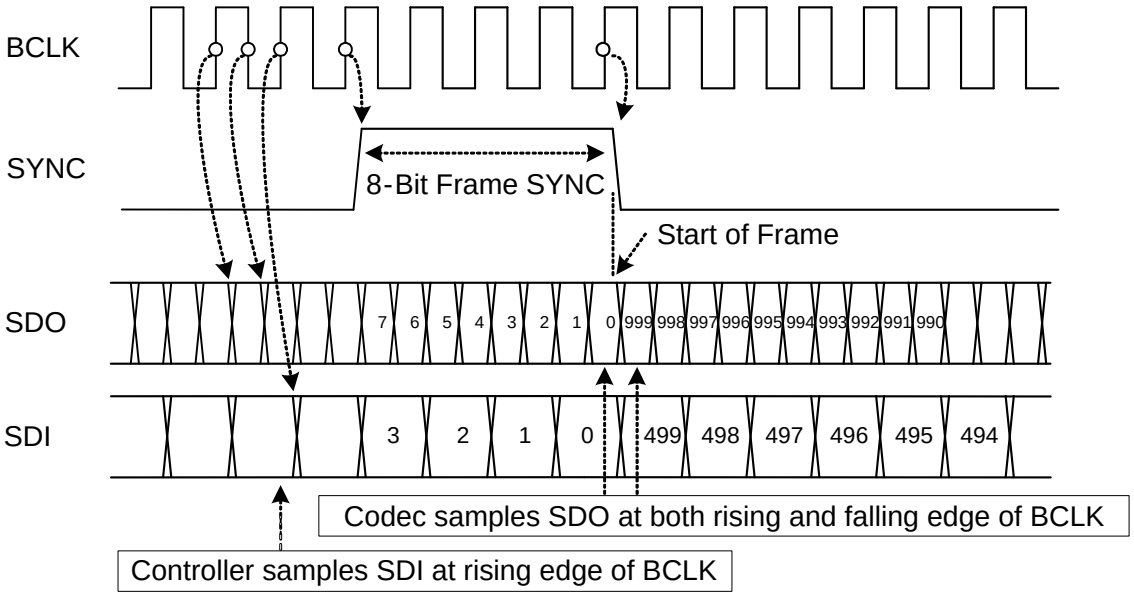

Figure 6. Bit Timing

7.1.2. Signaling Topology

The HDA controller supports two SDOs for the outbound stream, up to 15 SDIs for the inbound stream. RST#, BCLK, SYNC, SDO0 and SDO1 are driven by controller to codecs. Each codec drives its own point-to-point SDI signal(s) to the controller.

Figure 7 shows the possible connections between the HDA controller and codecs:

- Codec 0 is a basic connection. There is one single SDO and one single SDI for normal transmission
- Codec 1 has two SDOs for doubled outbound rate, a single SDI for normal inbound rate
- Codec 3 supports a single SDO for normal outbound rate, and two SDIs for doubled inbound rate
- Codec N has two SDOs and multiple SDIs

The multiple SDOs and multiple SDIs are used to expand the transmission rate between controller and codecs. Section 7.2 Frame Composition, page 15 describes the detailed outbound and inbound stream compositions for single and multiple SDOs/SDIs.

The connections shown in Figure 7 can be implemented concurrently in an HDA system. The ALC269-VC is designed to receive a single SDO stream.

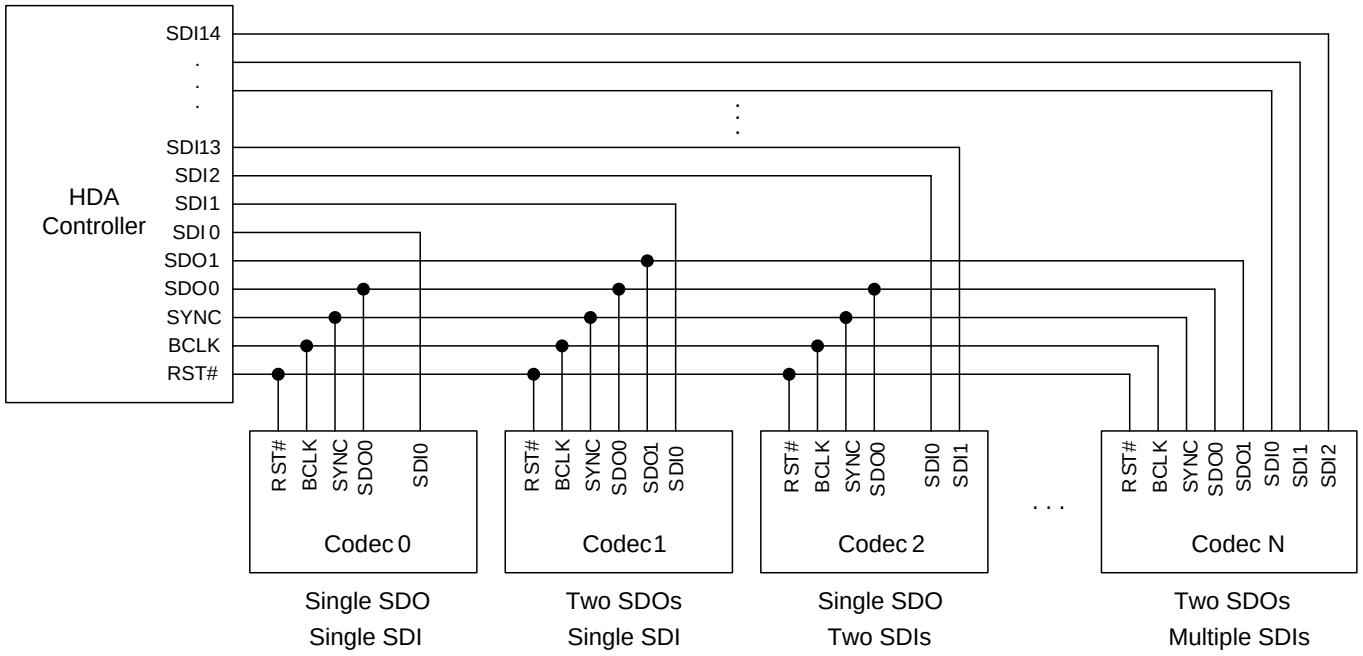

Figure 7. Signaling Topology

7.2. Frame Composition

7.2.1. Outbound Frame – Single SDO

An outbound frame is composed of one 32-Bit command stream and multiple data streams. There are one or multiple sample blocks in a data stream. Only one sample block exists in a stream if the HDA controller delivers a 48kHz rate of samples to the codec. Multiple sample blocks in a stream means the sample rate is a multiple of 48kHz. This means there should be 2 blocks in the same stream to carry 96kHz samples (Figure 8).

For outbound frames, the stream tag is not in SDO, but in the SYNC signal. A new data stream is started at the end of the stream tag. The stream tag includes a 4-Bit preamble and 4-Bit stream ID (Figure 9).

To keep the cadence of converters bound to the same stream, samples for these converters must be placed in the same block.

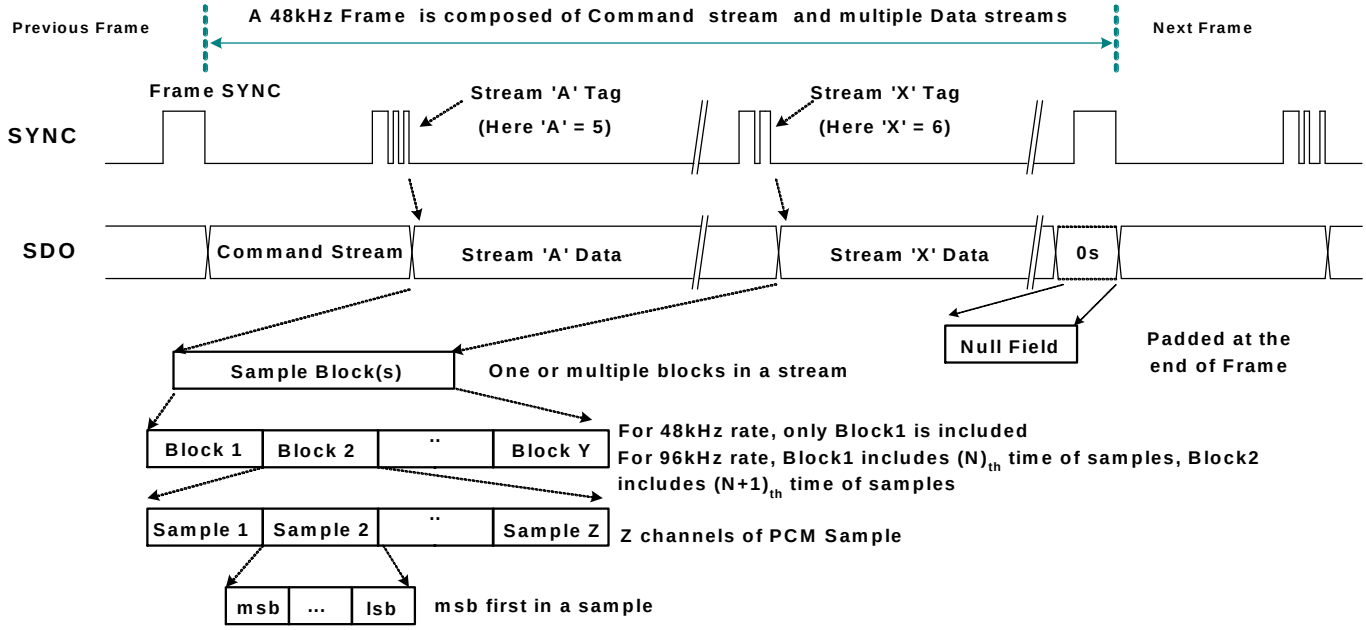

Figure 8. SDO Outbound Frame

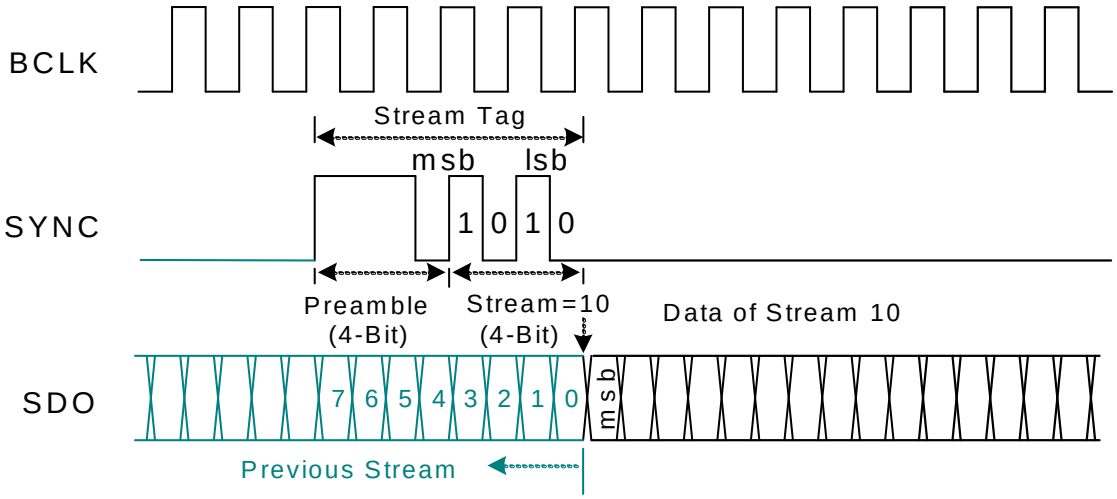

Figure 9. SDO Stream Tag is Indicated in SYNC

7.2.2. Inbound Frame – Single SDI

An Inbound Frame – Single SDI is composed of one 36-Bit response stream and multiple data streams. Except for the initialization sequence (turnaround and address frame), SDI is driven by the codec at each rising edge of BCLK. The controller also samples data at the rising edge of BCLK (Figure 10).

The SDI stream tag is not carried by SYNC, but included in the SDI. A complete SDI data stream includes one 4-Bit stream tag, one 6-Bit data length, and n-Bit sample blocks. Zeros will be padded if the total length of the contiguous sample blocks within a given stream is not of integral byte length (Figure 11).

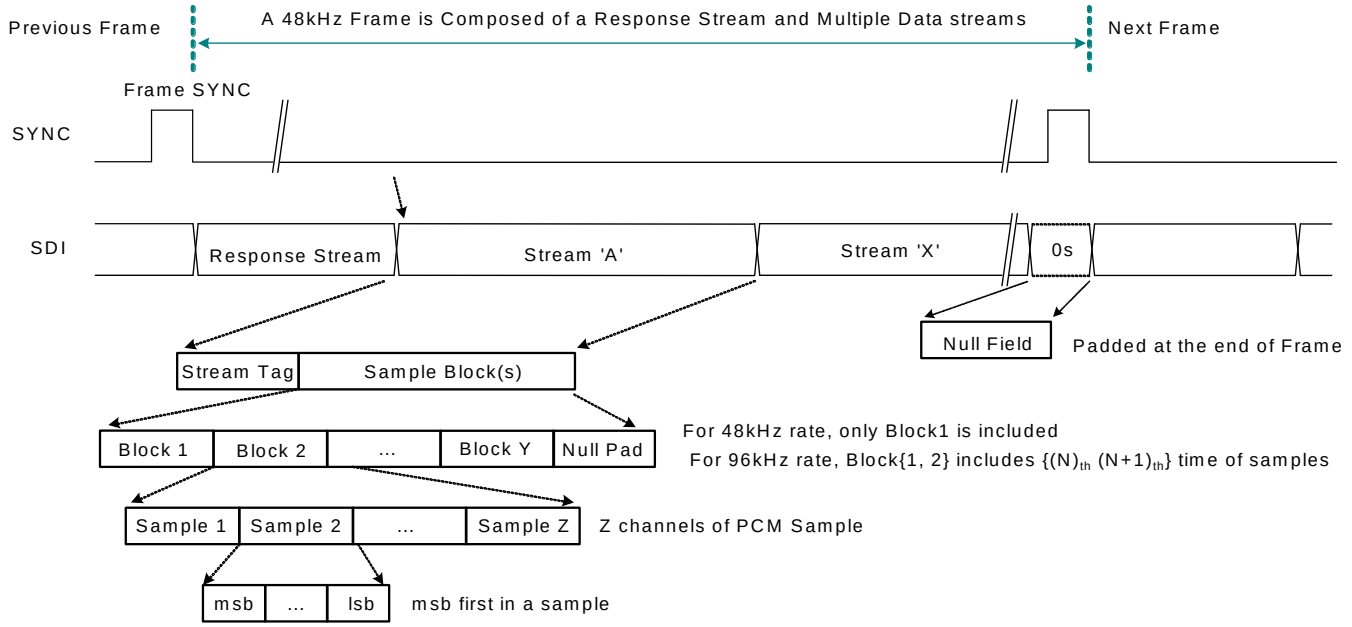

Figure 10. SDI Inbound Stream

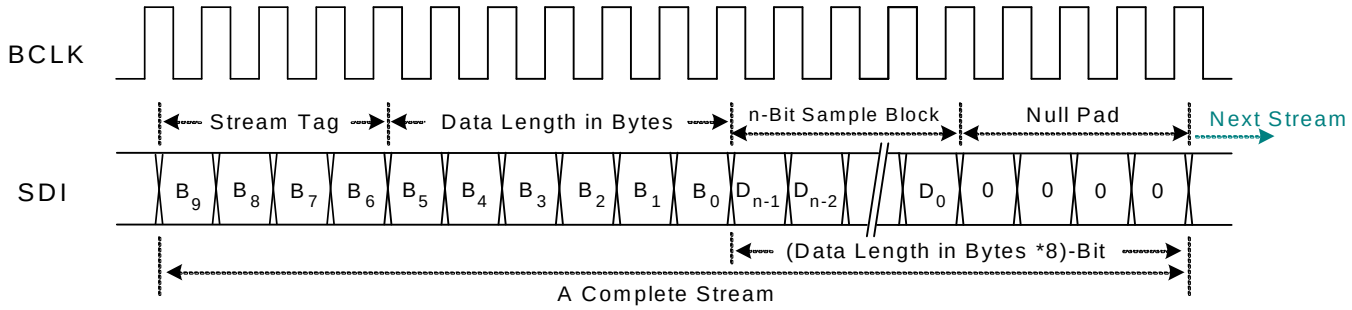

Figure 11. SDI Stream Tag and Data

7.2.3. Variable Sample Rates

The HDA link is designed for sample rates of 48kHz. Variable rates of sample are delivered in multiple or sub-multiple rates of 48kHz. Two sample blocks per frame result in a 96kHz delivery rate, one sample block over two frames results in a 24kHz delivery rate. The HDA specification states that the sample rate of the outbound stream be synchronized by the controller, not by the codec. Each stream has its own sample rate, independent of any other stream.

The HDA controller supports 48kHz and 44.1kHz base rates. Table 7, page 18, shows the recommended sample rates based on multiples or sub-multiples of one of the two base rates.

Rates in sub-multiples (1/n) of 48kHz are interleaving n frames containing no sample blocks. Rates in multiples (n) of 48kHz contain n sample blocks in a frame. Table 8, page 18, shows the delivery cadence of variable rates based on 48kHz.

The HDA link is defined to operate at a fixed 48kHz frame rate. To deliver samples in (sub) multiple rates of 44.1kHz, an appropriate ratio between 44.1kHz and 48kHz must be maintained to avoid frequency drift. The appropriate ratio between 44.1kHz and 48kHz is 147/160. Meaning 147 sample blocks are transmitted every 160 frames.

The cadence '12-11-11-12-11-11-12-11-11-12-11-11-11- (repeat)'interleaves 13 frames containing no sample blocks in every 160 frames. It provides a low long-term frequency drift for 44.1kHz of delivery rate. Rates in sub-multiples (1/n) of 44.1kHz also follow this cadence AND interleave n empty frames. Rates in multiples (n) of 44.1kHz applying this cadence contain n sample blocks in the non-empty frame AND interleave an empty frame between non-empty frames (Table 9, page 19).

Table 7. Defined Sample Rate and Transmission Rate

(Sub) Multiple	48kHz Base	44.1kHz Base
1/6	8kHz (1 sample block every 6 frames)	-

7.3. Reset and Initialization

There are two types of reset within an HDA link:

- Link Reset. Generated by assertion of the RST# signal, all codecs return to their power on state
- Codec Reset. Generated by software directing a command to reset a specific codec back to its default state

An initialization sequence is requested after any of the following three events:

1. Link Reset

2. Codec Reset

3. Codec changes its power state (For example, hot docking a codec to an HDA system)

7.3.1. Link Reset

A link reset may be caused by 3 events:

1. The HDA controller asserts RST# for any reason (power up, or PCI reset)

2. Software initiates a link reset via the 'CRST' bit in the Global Control Register (GCR) of the HDA controller

3. Software initiates power management sequences. Figure 12, page 21, shows the 'Link Reset' timing including the 'Enter' sequence (❶~❺) and 'Exit' sequence (❻~❾)

Enter 'Link Reset':

❶ Software writes a 0 to the 'CRST' bit in the Global Control Register of the HDA controller to initiate a link reset

❷ As the controller completes the current frame, it does not signal the normal 8-Bit frame SYNC at the end of the frame

❸ The controller drives SYNC and all SDOs to low. Codecs also drive SDIs to low

❹ The controller asserts the RST# signal to low, and enters the 'Link Reset' state

❺ All link signals driven by controller and codecs should be tri-state by internal pull low resistors

Exit from 'Link Reset':

❻ If BCLK is re-started for any reason (codec wake-up event, power management, etc.)

❼ Software is responsible for de-asserting RST# after a minimum of 100µsec BCLK running time (the 100µsec provides time for the codec PLL to stabilize)

❽ Minimum of 4 BCLK after RST# is de-asserted, the controller starts to signal normal frame SYNC

❾ When the codec drives its SDI to request an initialization sequence (when the SDI is driven high at the last bit of frame SYNC, it means the codec requests an initialization sequence)

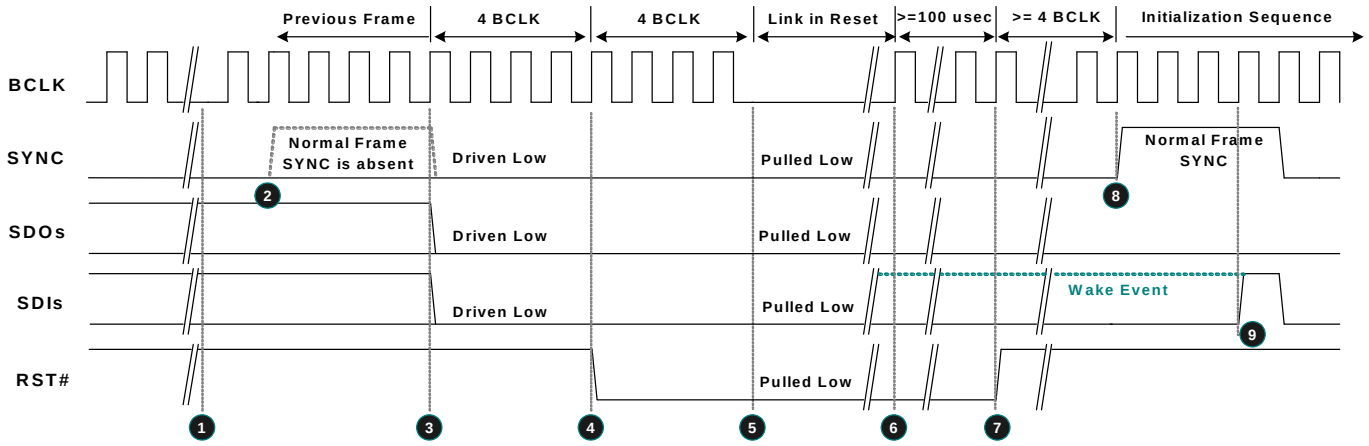

Figure 12. Link Reset Timing

7.3.2. Codec Reset

A 'Codec Reset' is initiated via the Codec RESET command verb. It results in the target codec being reset to the default state. After the target codec completes its reset operation, an initialization sequence is requested.

7.3.3. Codec Initialization Sequence

❶ The codec drives SDI high at the last bit of SYNC to request a Codec Address (CAD) from the controller

❷ The codec will stop driving the SDI during this turnaround period

❸❹❺❻ The controller drives SDI to assign a CAD to the codec

❼ The controller releases the SDI after the CAD has been assigned

❽ Normal operation state

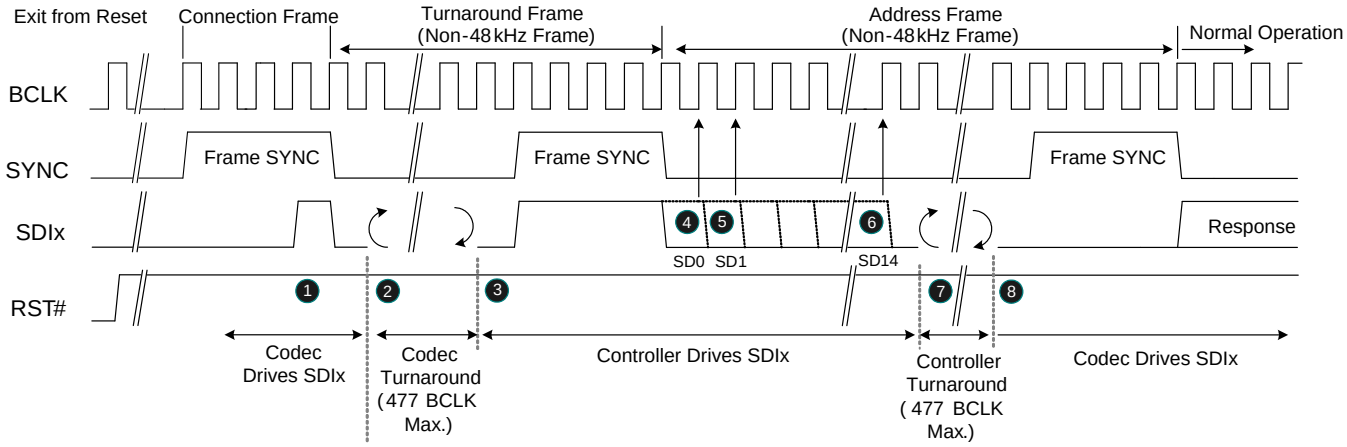

Figure 13. Codec Initialization Sequence

7.4. Verb and Response Format

7.4.1. Command Verb Format

There are two types of verbs: one with 4-Bit identifiers (4-Bit verbs) and 16-Bits of data, the other with 12-Bit identifiers (12-Bit verbs) and 8-Bits of data. Table 10 shows the 4-Bit verb structure of a command stream sent from the controller to operate the codec. Table 11 is the 12-Bit verb structure that gets and controls parameters in the codec.

7.4.2. Response Format

There are two types of response from the codec to the controller. Solicited Responses are returned by the codec in response to a current command verb. The codec will send Solicited Response data in the next frame, without regard to the Set (Write) or Get (Read) command. The 32-Bit Response is interpreted by software, opaque to the controller.

Unsolicited Responses are sent by the codec independently of software requests. Jack Detection or GPI status information can be actively delivered to the controller and interpreted by software. The 'Tag' in Bit[31:28] is used to identify unsolicited events. This tag is undefined in the HDA specifications.

Table 12. Solicited Response Format

Bit [35]	Bit [34]	Bit [33:32]	Bit [31:0]
Valid	Unsol=0	Reserved	Response

Table 13. Unsolicited Response Format

Bit [35]	Bit [34]	Bit [33:32]	Bit [31:28]	Bit [27:0]
Valid	Unsol=1	Reserved	Tag	Response

Note: The response stream in the link protocol is 36-Bits wide. The response is placed in the lower 32-bit field. Bit-35 is a 'Valid' bit to indicate the response is 'Ready'. Bit-34 is set to indicate that an unsolicited response was sent.

7.4.3. Double Function Reset

This reset is executed by sending two Function Group resets back to back. This Function Group "Double" reset shall do a full initialization and reset all settings to their power on defaults. This Double Reset is defined as two Function Group Reset verbs received without any other intervening valid verbs. The reset verbs are not necessary to be received in sequential frames, but there must not be any other verbs received in frames between the conceptive of the Function Group Reset verbs. It is allowed that there are several null commands received in frames between Function Group Reset verbs.

7.5. Power Management

ALC269-VC meets the INTEL's Audio CODEC low power state white paper and it's ECR I-015B compliant. And ALC269-VC has the follow 5 attributes (INTEL's white paper).

D3 state power < 30mW(without PC-Beep pass-through Function)

1. With PC-Beep pass-through Function, the criteria is 60mW.

2. Exit latency (D3 to D0 transfer) < 10ms.

3. Audio pop/click suppression during D3 and D0 transision < -65dBV.

4. Support Jack detection in D3 state.

5. D3 function work with or without the BITCLK.

ALC269-VC minimizes the idle power for D3 state that allow system to entry D3 mode when CODEC is idle. And it will save power consumption for idle mode and increase overall battery life for mobile system.

In D3 mode, only power on reset or "double function reset" could reset all settings of ALC269-VC. SW would not spend a lot of time for configure the CODEC to the previous setting when CODEC entry to the D3. System would reduce the latency time for CODEC's D3 to D0 transition.

ALC269-VC supports Wake-Up event in low power mode, D3. ALC269-VC would generate the wake-up event caused by the changing of jack detection or GPIO status in D3, If HDA-Link was alive (with

BCLK), CODEC would response as a normal operation. And if the BITCLK disappeared, CODEC would drive the SDI as high to wake up the system.

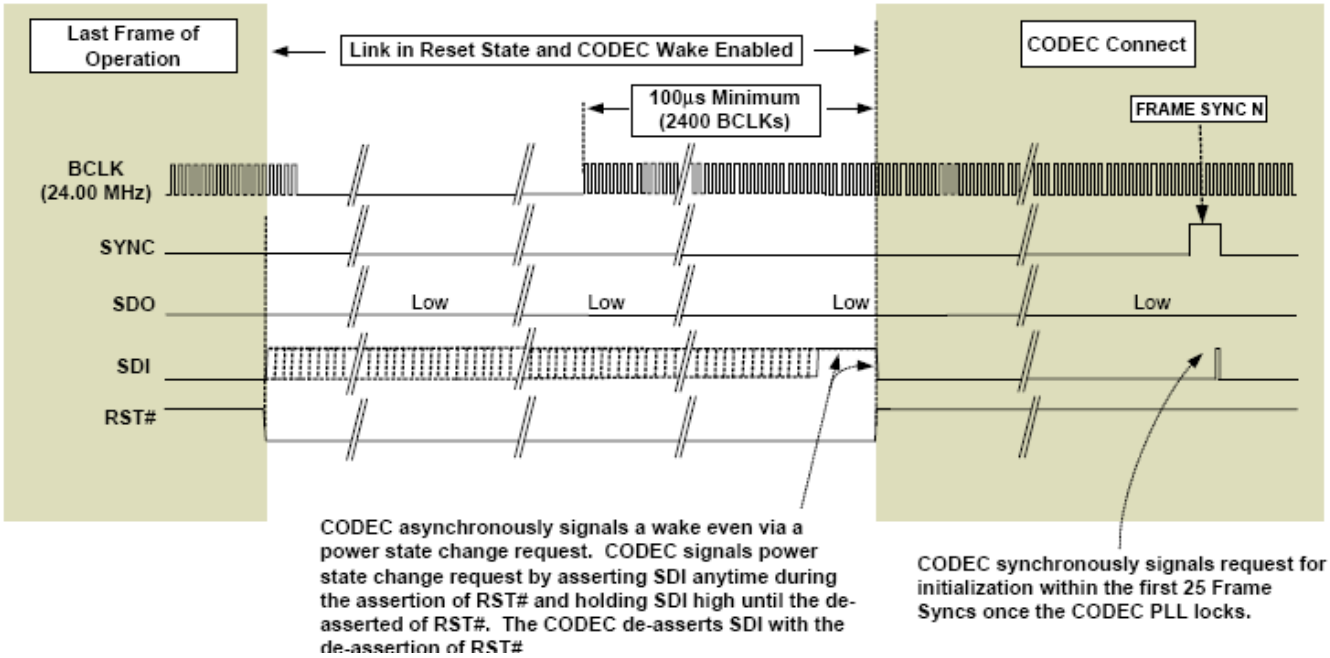

Figure 14. Resume from the external event (Wake-up event)

All power management state changes in widgets are driven by software. Table 14 indicates the definitions of power states.

In ALC269-VC, the Audio Function (NID=01h), input converter, output converter, and every pin widget support power control. Software may have various power states dependent on system configuration. Table 15 indicates those Nodes supporting power management. To simplify power control, software can configure whole codec power states through the Audio Function (NID=01h) only. Output converters (DACs) and input converters (ADCs) also have individual power control to supply fine-Grained power control.

Table 14. System Power State Definitions

Power States	Definitions
D0	All power on. Individual DACs and ADCs can be powered up or down as required.
D1	All converters (DACs and ADCs) are powered down. State maintained, analog reference stays up.
D2	All amplifiers and converters (DACs and ADCs) are powered down. State maintained, but analog reference off (D1 + analog reference off).
D3	Power still supplied. The codec stops the internal clock. State is maintained.
D3 (No BitCLK)	Powers are still supplied, BITCLK stop and Reset in low state.

Table 16. Powered Down Conditions

Condition	Description
LINK Response powered down	Internal clock is stopped. SDATA-IN and SPDIF-OUT are floated with pulled low 47K resistors internally. Detection of 'Link Reset Entry' and 'Link Reset Exit' sequences are supported. All states are maintained if DVDD is supplied.
DAC powered down	Analog block and digital filter are powered down.
ADC powered down	Analog block and digital filter are powered down. The data on SDATA-IN is quiet.
Headphone Driver powered down	All headphone drivers are powered down.
Mixers powered down	All internal mixer widgets are powered down. The DC reference and VREFOUTx at individual pin complexes are still alive.
Reference power down	All internal references, DC reference, and VREFOUTx at individual pin complexes are off.

8. Supported Verbs and Parameters

This section describes the Verbs and Parameters supported by various widgets in the ALC269-VC. If a verb is not supported by the addressed widget, it will respond with 32 bits of '0'.

8.1. Verb – Get Parameters (Verb ID=F00h)

The 'Get Parameters' verb is used to get system information and the function capabilities of the HDA codec. All the parameters are read-only. Refer to section 7.4.1 Command Verb Format, page 23, to get detailed information about supported parameters.

Table 17. Verb – Get Parameters (Verb ID=F00h)

Bit	Description
31:16	Vendor ID=10ECh (Realtek's PCI vendor ID).
15:0	Device ID=0269h.

Note: The Root Node (NID=00h) supports this parameter.

8.1.2. Parameter – Revision ID (Verb ID=F00h, Parameter ID=02h)

Table 19. Parameter – Revision ID (Verb ID=F00h, Parameter ID=02h)

Codec Response Format

Bit	Description
31:24	Reserved. Read as 0's.
23:20	MajRev. The major version number (in decimal) of the HDA Spec to which the ALC269-VC is fully compliant.
19:16	MinRev. The minor version number (in decimal) of the HDA Spec to which the ALC269-VC is fully compliant.
15:8	Revision ID. The vendor's revision number. 00h is for the first silicon version A, 01h is for the second version B, etc.
7:0	Stepping ID. The vendor's stepping number within the given Revision ID.

Note: The Root Node (NID=00h in the ALC269-VC) supports this parameter.

For example, Revision ID=02h and Stepping ID=00h indicates the silicon is the C0 version. (First version of ALC269-VC)

8.1.3. Parameter – Subordinate Node Count (Verb ID=F00h, Parameter ID=04h)

For the root node, the Subordinate Node Count provides information about audio function group nodes associated with the root node. For function group nodes, it provides the total number of widgets associated with this function node.

Table 20. Parameter – Subordinate Node Count (Verb ID=F00h, Parameter ID=04h)

8.1.9. Parameter – Pin Capabilities (Verb ID=F00h, Parameter ID=0Ch)

The Pin Capabilities parameter returns a bit field describing the capabilities of the Pin Complex widget.

Table 26. Parameter – Pin Capabilities (Verb ID=F00h, Parameter ID=0Ch)

Codec Response Format

Bit	Description
31:16	Reserved. Read as 0's.
15:8	VREF Control Capability. '1' in corresponding bit field indicates signal levels of associated Vrefout are specified as a percentage of AVDD.
7	L-R Swap. Indicates the capability of swapping the left and rights.
6	Balanced I/O Pin. '1' indicates this pin complex has balanced pins.
5	Input Capable. '1' indicates this pin complex supports input.
4	Output Capable. '1' indicates this pin complex supports output.
3	Headphone Drive Capable. '1' indicates this pin complex has an amplifier to drive a headphone.
2	Presence Detect Capable. '1' indicates this pin complex can detect whether there is anything plugged in.
1	Trigger Required. '1' indicates whether a software trigger is required for an impedance measurement.
0	Impedance Sense Capable. '1' indicates this pin complex can perform analog sense on the attached device to determine its type.

'Response' for NID=01h (Audio Function Group)

Bit	Description
31:8	Reserved.
7:0	Frequency Divider, F[7:0]. The internal BEEP frequency is the result of dividing the 48kHz clock by 4 times the number specified in F[7:0]. The lowest tone is 48kHz/(255*4)=47Hz. The highest tone is 48kHz/(1*4)=12kHz. A value of 00h in F[7:0] disables the internal BEEP generator and allows external PCBEEP input.

Codec Response Format

Response [31:0]
Bit[1] is EAPD Control

Codec response in Get Command for NID=14h (SPK-OUT Pin Widget), 15h (HP-OUT Pin Widget)

Bit	Description
31:3	Reserved.
2	L-R Swap. The ALC269-VC does not support swapping left and right channel, it is read as 0.

Codec response in Get Command for NID=14h (SPK-OUT Pin Widget), 15h (HP-OUT Pin Widget)

Bit	Description
1	EAPD Value. 0: EAPD pin state is low potential to power down external amplifier in all power state of AFG. 1: EAPD pin state is high potential to power up external amplifier in all power state of AFG.
0	BTL Enable. The ALC269-VC does not support this control bit, it is read as 0.

Codec Response in Get Command for other NID

Bit	Description
31:0	0s.

9. Electrical Characteristics

9.1. DC Characteristics

9.1.1. Absolute Maximum Ratings

Table 77. Absolute Maximum Ratings

Parameter	Symbol	Minimum	Typical	Maximum	Units
Power Supplies					
Digital Power for Core	DVDD	3.0	3.3	3.6	V
Digital Power for Link	DVDD-IO	1.5	3.3	3.6	V
Analog Power	AVDD1, AVDD2	4.75	5.0	5.25	V
BTL Analog Power	PVDD1, PVDD2	4.75	5.0	5.25	V
Ambient Operating Temperature	Ta	0	-	+70	°C
Storage Temperature	Ts	-	-	+125	°C
ESD (Electrostatic Discharge)					
	Susceptibility Voltage				
All Pins	3500V				

Note1: PVDD must be greater than AVDD.

Note2: When the Class-D amplifier is operating, surges of PVDD > 7V duration for 0.1ms may damage the amplifier. To suppress such surges, 10μF tantalum capacitors are required at PVDD1 and PVDD2.

Note3: The standard testing before shipping is AVDD =5.0V unless specified. Customers designing with a different AVDD should contact Realtek technical support representatives for special testing support.

9.1.2. Threshold Voltage

DVDD-IO=3.3V±5%, $T_{ambient}$=25°C, with 50pF external load.
