1. General Description

The ALC269 is a High Definition Audio Codec that integrates a 2+2-channel DAC, a 4-channel ADC, and a Class D Speaker Amplifier.

The 2+2-channel DAC supports two independent stereo sound outputs simultaneously. The 4-channel ADC integrates two stereo and independent analog sound inputs (multiple streaming).

The ALC269 incorporates Realtek converter technology to achieve a 98dB dynamic range playback quality and a 98dB dynamic range recording quality. It meets the current WLP3.10 (Windows Logo Program) and future WLP requirements that become effective from 01 June 2008.

The ALC269 also supports stereo digital microphone channels (microphone array) with Acoustic Echo Cancellation (AEC), Beam Forming (BF), and Noise Suppression (NS) technology simultaneously, significantly improving voice quality for PC VoIP applications.

As well as basic audio functions, the ALC269 has two independent S/PDIF outputs; one could be used to connect a PC to high-quality consumer electronic products such as digital decoders and speakers, the other could provide a dedicated digital output to a HDMI transmitter (common in high end PCs).

There are three integrated power amplifiers. The first is a linear headphone amplifier at port C. The second headphone amplifier at port A removes the need for external DC blocking capacitors, eliminating pop noise caused by these capacitors. The third is an integrated stereo Class D amplifier to directly drive a mini-speaker. The Class D amplifier is designed to drive speakers with as low as 4 Ω impedance. Its maximum output power is 2.3W per channel at 5V power supply. The advantage of an integrated Class D amplifier in the ALC269 is high efficiency with low power consumption.

The ALC269 integrates five hardware equalizer bands composed of one low-pass filter, one high-pass filter, and three band-pass filters to compensate for mini-speaker frequency response. All the equalizer filters are programmable via the BIOS, allowing the equalizer to function without the need to customize the audio driver.

The ALC269 conforms to Intel's Audio Codec low power state white paper and is ECR compliant.

Note: ALC269 version differences are listed in section 12 Ordering Information, page 71.

2. Features

2.1. *Hardware Features*

- 98dB Signal-to-Noise Ratio (A-weighting) for DAC output
- 98dB Signal-to-Noise Ration (A-weighting) for ADC input
- Meets WLP (Windows Logo Program) 3.10 and future WLP requirements that become effective from 01 June 2008
- 2+2-channel DAC supports 16/20/24-bit PCM format for independent two stereo channel audio playback
- 4-channel ADC supports 16/20/24-bit PCM format for independent two stereo channel audio inputs
- All DACs supports 44.1/48/96/192kHz sample rate
- All ADCs support 44.1/48/96kHz sample rate
- S/PDIF-OUT support 16/20/24-bit format and 32/44.1/48/88.2/96/192kHz rate
- Supports MONO line level output
- Supports external PCBEEP input and built-in digital BEEP generator
- Software selectable 2.5V/3.2V/4.2V VREFOUT as bias voltage for analog microphone input
- Two jack detection pins each designed to detect up to 4 jacks
- 1dB resolution of input and output volume control
- Programmable +10/+20/+30dB boost gain for analog microphone input
- Built-in headphone amplifiers for port-A and port-C.
- 2 GPIOs are supported for customized applications (pin shared with digital microphone interface)
- EAPD (External Amplifier Power Down) is supported (pin shared with secondary S/PDIF-OUT)
- Supports Anti-pop mode when analog power AVDD is on and digital power is off
- Power support: 3.3V digital core power; 1.5V~3.3V digital IO power for HDA link; 3.3V~5.0V analog power; 3.3V~5.0V power stage voltage
- Enhanced power management features

- Secondary S/PDIF-OUT supports 16/20/24-bit format and 32k/44.1k/48k/88.2k/96k/192kHz rate
- Supports stereo digital microphone input
- Programmable boost gain and volume control for digital microphone input
- Headphone amplifier for port-A does not require DC blocking capacitors
- Stereo Bridge-Tied Load Class-D amplifier at port-D has 2Watt (rms)/4 Ω per channel output
- Short circuit and thermal overload protection for Class D amplifier
- Supports digital PWM output at port-D which system integrator can easily connect the output to external power amplifier receives digital audio stream
- Five band hardware equalizer designed for BTL output (port-D) to compensate for frequency response while driving the mini-speaker
- Intel low power ECR compliant: supports power status control, jack detection, and wake-up event in D3 mode
- 48-pin QFN 'Green' package

2.2. Software Features

- Compatible with Windows Logo Program 3.10 and future requirements that become effective from 01 June 2008
- WaveRT-based audio function driver for Windows Vista
- EAX™ 1.0 & 2.0 compatible
- Direct Sound 3D™ compatible
- A3D™ compatible
- I3DL2 compatible
- HRTF 3D Positional Audio (Windows XP only)
- Emulation of 26 sound environments to enhance gaming experience
- Multi-band software equalizer and tools
- Voice Cancellation and Key Shifting in Karaoke mode

- Dynamic range control (expander, compressor, and limiter) with adjustable parameters
- Intuitive Configuration Panel (Realtek Audio Manager) to enhance user experience
- Provides 10-foot GUI for Windows Media Center
- Microphone Acoustic Echo Cancellation (AEC), Noise Suppression (NS), and Beam Forming (BF) technology for voice application
- Smart multiple streaming operation
- HDMI audio driver for AMD platform
- Dolby[®] PCEE program[™] (optional software feature)
- SRS[®] TrueSurround HD (optional software feature)
- Fortemedia[®] SAM[™] technology for voice processing (Beam Forming and Acoustic Echo Cancellation) (optional software feature)

3. System Applications

- Windows Vista premium desktop and laptop PCs
- Information appliances (IA) with High Definition Audio Controller

4.1. Analog Input/Output Unit

Pin widgets NID=18h, 19h, 1Ah, and 1Bh are re-tasking IO supporting input units. NID=15h and 1Ah support amplifier units.

7. High Definition Audio Link Protocol

7.1. Link Signals

The High Definition Audio (HDA) Link is the digital serial interface that connects the HDA codecs to the HDA Controller. The HDA link protocol is controller synchronous, based on a 24.0MHz BIT-CLK sent by the HDA controller. The input and output streams, including command and PCM data, are isochronous with a 48kHz frame rate. Figure 4 shows the basic concept of the HDA link protocol.

Figure 4. HDA Link Protocol

7.1.1. Signal Definitions

Table 5. Link Signal Definitions

Item	Description
BCLK	24.0MHz bit clock sourced from the HDA controller and connected to all codecs.
SYNC	48kHz signal used to synchronize input and output streams on the link. It is sourced from the HDA controller and connects to all codecs.
SDO	Serial Data Output signal driven by the HDA controller to all codecs. Commands and data streams are carried on SDO. The data rate is double pumped; the controller drives data onto the SDO, the codec samples data present on SDO with respect to each edge of BCLK. The HDA controller must support at least one SDO. To extend outbound bandwidth, multiple SDOs may be supported.
SDI	Serial Data Input signal driven by the codec. It is point-to-point serial data from the codec to the HDA controller. The controller must support at least one SDI, and up to a maximum of 15 SDI's can be supported. SDI is driven by the codec at each rising edge of BCLK, and sampled by the controller at each rising edge of BCLK. SDI can be driven by the controller to initialize the codec's ID.
RST#	Active low reset signal. Asserted to reset the codec to default power on state. RST# is sourced from the HDA controller and connects to all codecs.

Table 6. HDA Signal Definitions

Signal Name	Source	Controller Type	Description
BCLK	Controller	Output	Global 24.0MHz Bit Clock.
SYNC	Controller	Output	Global 48kHz Frame Sync and outbound tag signal.
SDO	Controller	Output	Serial Data Output from Controller.
SDI	Codec/Controller	Input/Output	Serial Data Input from codec. Weakly pulled down by the controller.
RST#	Controller	Output	Global Active Low Reset Signal.

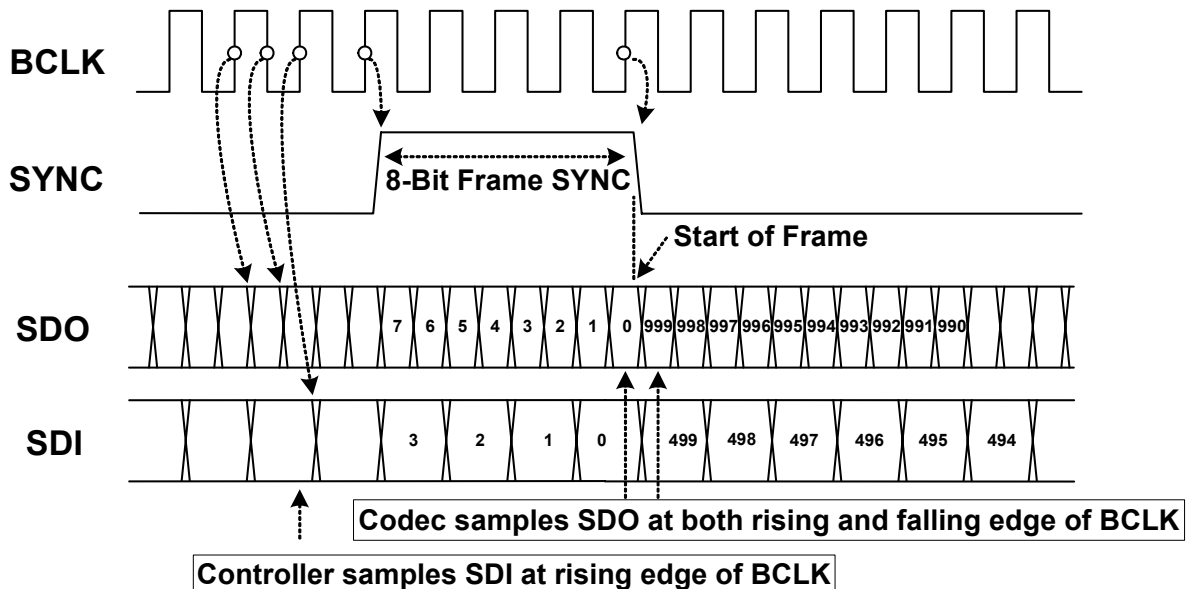

Figure 5. Bit Timing

7.1.2. Signaling Topology

The HDA controller supports two SDOs for the outbound stream, up to 15 SDIs for the inbound stream. RST#, BCLK, SYNC, SDO0 and SDO1 are driven by controller to codecs. Each codec drives its own point-to-point SDI signal(s) to the controller.

Figure 6 shows the possible connections between the HDA controller and codecs:

- Codec 0 is a basic connection. There is one single SDO and one single SDI for normal transmission
- Codec 1 has two SDOs for doubled outbound rate, a single SDI for normal inbound rate
- Codec 3 supports a single SDO for normal outbound rate, and two SDIs for doubled inbound rate
- Codec N has two SDOs and multiple SDIs

The multiple SDOs and multiple SDIs are used to expand the transmission rate between controller and codecs. Section 7.2 Frame Composition, page 13 describes the detailed outbound and inbound stream compositions for single and multiple SDOs/SDIs.

The connections shown in Figure 6 can be implemented concurrently in an HDA system. The ALC269 is designed to receive a single SDO stream.

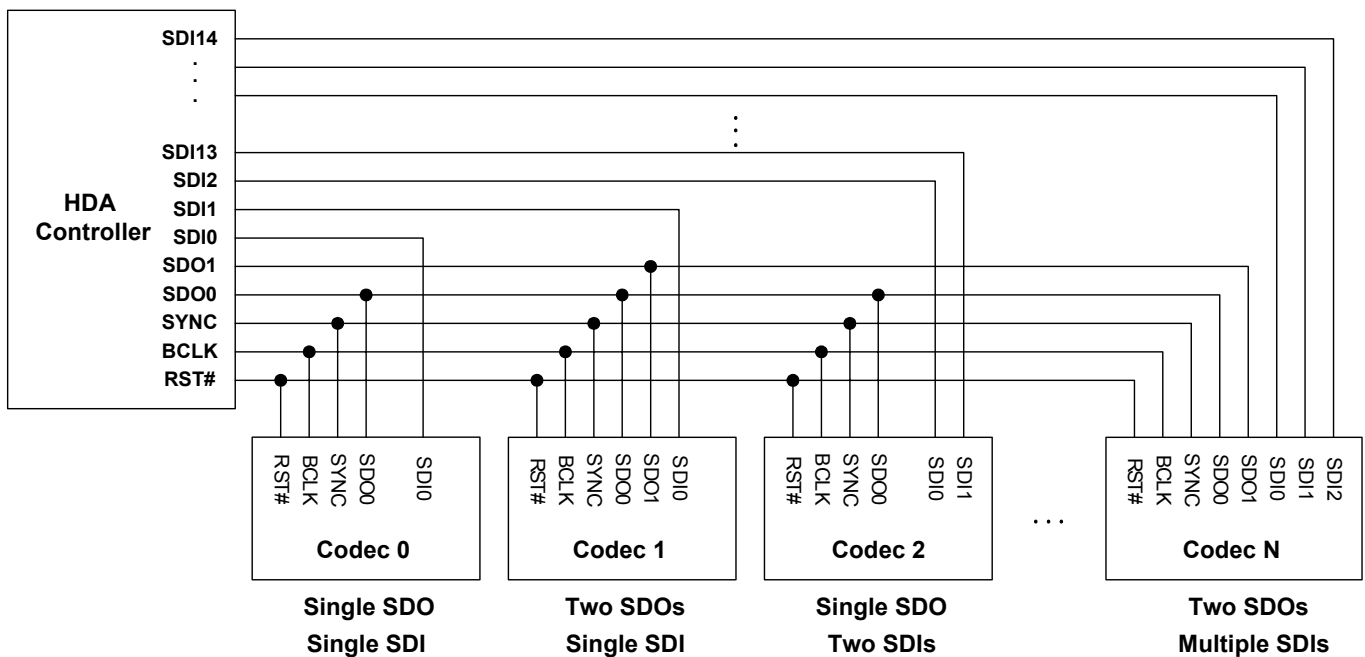

Figure 6. Signaling Topology

7.2. Frame Composition

7.2.1. Outbound Frame – Single SDO

An outbound frame is composed of one 32-Bit command stream and multiple data streams. There are one or multiple sample blocks in a data stream. Only one sample block exists in a stream if the HDA controller delivers a 48kHz rate of samples to the codec. Multiple sample blocks in a stream means the sample rate is a multiple of 48kHz. This means there should be 2 blocks in the same stream to carry 96kHz samples (Figure 7).

For outbound frames, the stream tag is not in SDO, but in the SYNC signal. A new data stream is started at the end of the stream tag. The stream tag includes a 4-Bit preamble and 4-Bit stream ID (Figure 8).

To keep the cadence of converters bound to the same stream, samples for these converters must be placed in the same block.

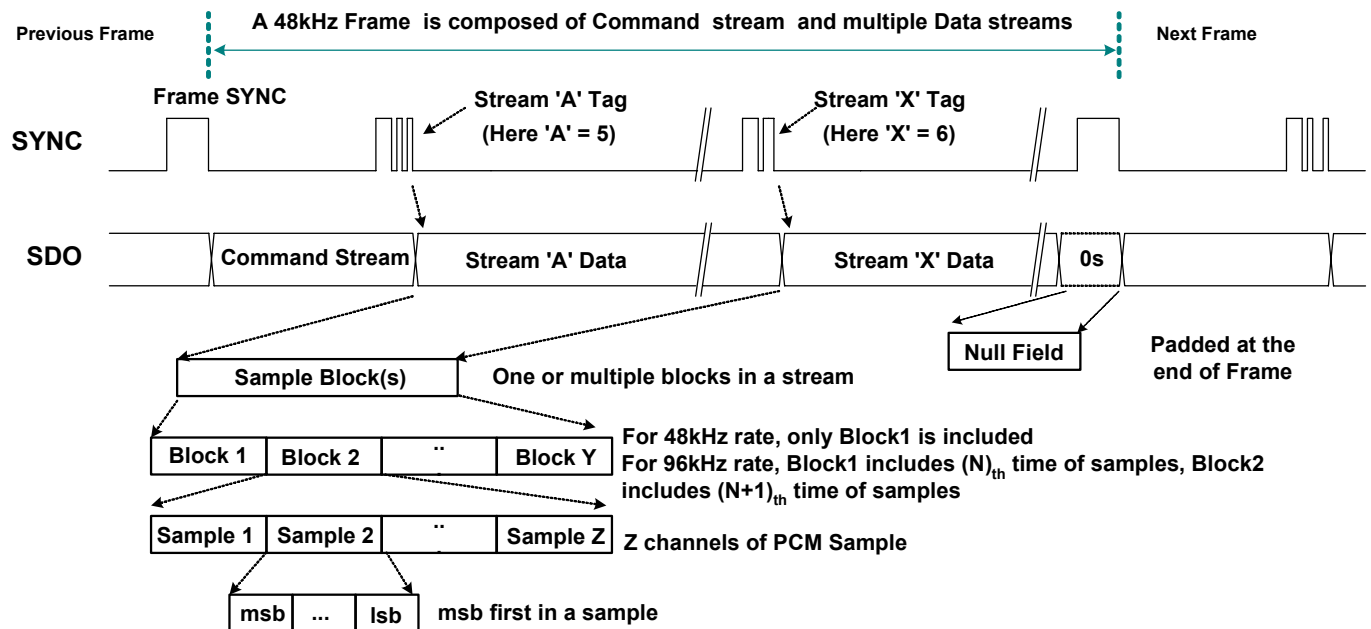

Figure 7. SDO Outbound Frame

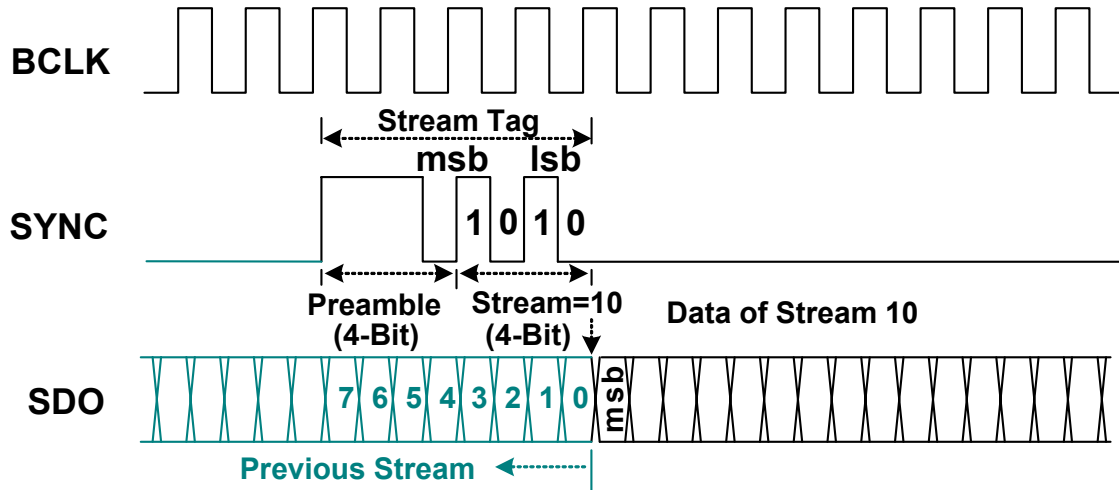

Figure 8. SDO Stream Tag is Indicated in SYNC

7.2.2. Outbound Frame – Multiple SDO

The HDA controller allows two SDO signals to be used to stripe outbound data, completing transmission in less time to get more bandwidth. If software determines the target codec supports multiple SDO capability, it enables the stripe control bit in the controller's Output Stream Control Register to initiate a specific stream (Stream 'A' in Figure 9) to be transmitted on multiple SDOs. In this case, the MSB of stream data is always carried on SDO0, the second bit on SDO1 and so forth.

SDO1 is for transmitting a striped stream. The codec does not support multiple SDOs connected to SDO0.

To guarantee all codecs can determine their corresponding stream, the command stream is not striped. It is always transmitted on SDO0, and copied on SDO1.

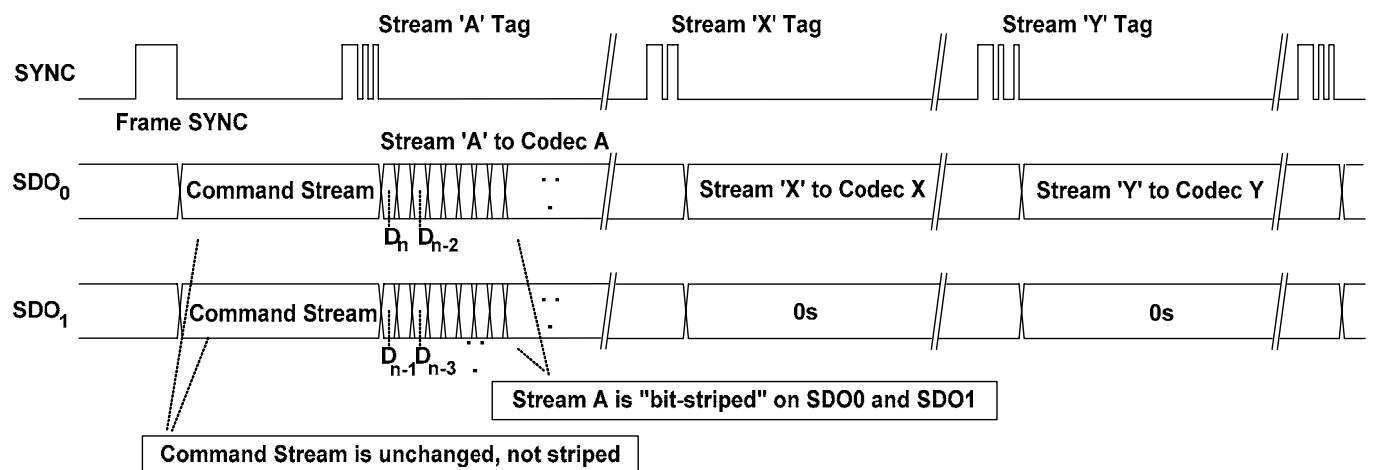

Figure 9. Striped Stream on Multiple SDOs

7.2.3. Inbound Frame – Single SDI

An Inbound Frame – Single SDI is composed of one 36-Bit response stream and multiple data streams. Except for the initialization sequence (turnaround and address frame), SDI is driven by the codec at each rising edge of BCLK. The controller also samples data at the rising edge of BCLK (Figure 10).

The SDI stream tag is not carried by SYNC, but included in the SDI. A complete SDI data stream includes one 4-Bit stream tag, one 6-Bit data length, and n-Bit sample blocks. Zeros will be padded if the total length of the contiguous sample blocks within a given stream is not of integral byte length (Figure 11).

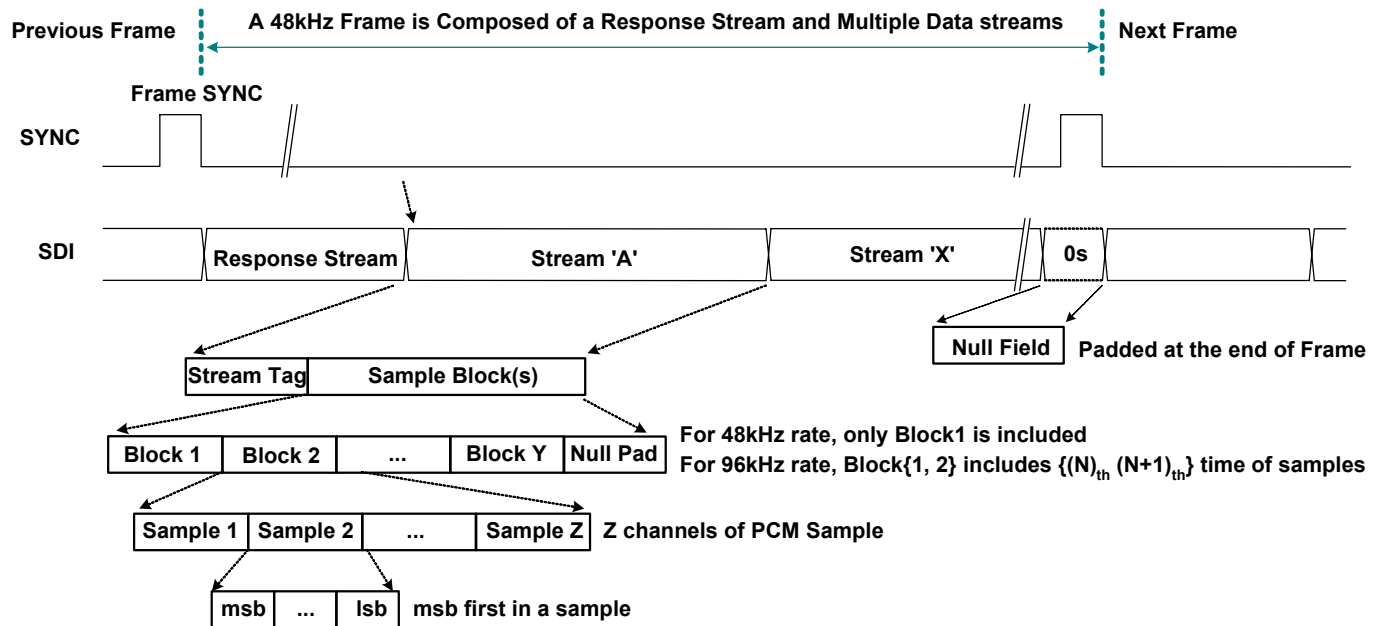

Figure 10. SDI Inbound Stream

Figure 11. SDI Stream Tag and Data

7.2.4. Inbound Frame – Multiple SDI

A codec can deliver data to the controller on multiple SDIs to achieve higher bandwidth. If an inbound stream exceeds the data transfer limits of a single SDI, the codec can divide the data onto separate SDI signals, each of which operate independently, with different stream numbers at the same frame time. This is similar to having multiple codecs connected to the controller. The controller samples the divided stream into separate memory with multiple DMA descriptors, then software re-combines the divided data into a meaningful stream.

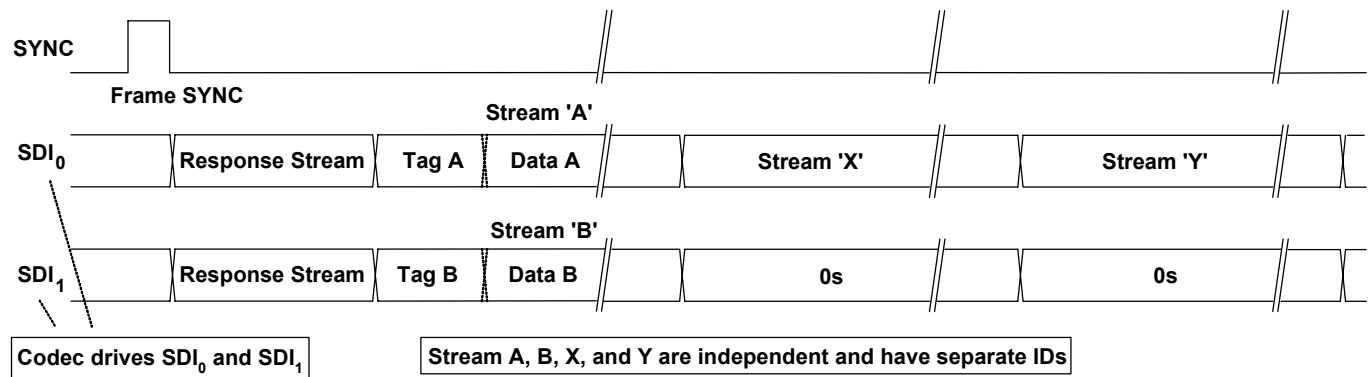

Figure 12. Codec Transmits Data Over Multiple SDIs

7.2.5. Variable Sample Rates

The HDA link is designed for sample rates of 48kHz. Variable rates of sample are delivered in multiple or sub-multiple rates of 48kHz. Two sample blocks per frame result in a 96kHz delivery rate, one sample block over two frames results in a 24kHz delivery rate. The HDA specification states that the sample rate of the outbound stream be synchronized by the controller, not by the codec. Each stream has its own sample rate, independent of any other stream.

The HDA controller supports 48kHz and 44.1kHz base rates. Table 7, page 17, shows the recommended sample rates based on multiples or sub-multiples of one of the two base rates.

Rates in sub-multiples (1/n) of 48kHz are interleaving n frames containing no sample blocks. Rates in multiples (n) of 48kHz contain n sample blocks in a frame. Table 8, page 17, shows the delivery cadence of variable rates based on 48kHz.

The HDA link is defined to operate at a fixed 48kHz frame rate. To deliver samples in (sub) multiple rates of 44.1kHz, an appropriate ratio between 44.1kHz and 48kHz must be maintained to avoid frequency drift. The appropriate ratio between 44.1kHz and 48kHz is 147/160. Meaning 147 sample blocks are transmitted every 160 frames.

The cadence ‘12-11-11-12-11-11-12-11-11-12-11-11-11- (repeat)’ interleaves 13 frames containing no sample blocks in every 160 frames. It provides a low long-term frequency drift for 44.1kHz of delivery rate. Rates in sub-multiples (1/n) of 44.1kHz also follow this cadence AND interleave n empty frames. Rates in multiples (n) of 44.1kHz applying this cadence contain n sample blocks in the non-empty frame AND interleave an empty frame between non-empty frames (Table 9, page 18).

7.3. Reset and Initialization

There are two types of reset within an HDA link:

- Link Reset. Generated by assertion of the RST# signal, all codecs return to their power on state
- Codec Reset. Generated by software directing a command to reset a specific codec back to its default state

An initialization sequence is requested after any of the following three events:

1. Link Reset
2. Codec Reset
3. Codec changes its power state (For example, hot docking a codec to an HDA system)

7.3.1. Link Reset

A link reset may be caused by 3 events:

1. The HDA controller asserts RST# for any reason (power up, or PCI reset)
2. Software initiates a link reset via the 'CRST' bit in the Global Control Register (GCR) of the HDA controller
3. Software initiates power management sequences. Figure 13, page 20, shows the 'Link Reset' timing including the 'Enter' sequence (❶~❺) and 'Exit' sequence (❻~❾)

Enter 'Link Reset':

- ❶ Software writes a 0 to the 'CRST' bit in the Global Control Register of the HDA controller to initiate a link reset
- ❷ As the controller completes the current frame, it does not signal the normal 8-Bit frame SYNC at the end of the frame
- ❸ The controller drives SYNC and all SDOs to low. Codecs also drive SDIs to low
- ❹ The controller asserts the RST# signal to low, and enters the 'Link Reset' state
- ❺ All link signals driven by controller and codecs should be tri-state by internal pull low resistors

Exit from ‘Link Reset’:

- ⑥ If BCLK is re-started for any reason (codec wake-up event, power management, etc.)
- ⑦ Software is responsible for de-asserting RST# after a minimum of 100μsec BCLK running time (the 100μsec provides time for the codec PLL to stabilize)
- ⑧ Minimum of 4 BCLK after RST# is de-asserted, the controller starts to signal normal frame SYNC
- ⑨ When the codec drives its SDI to request an initialization sequence (when the SDI is driven high at the last bit of frame SYNC, it means the codec requests an initialization sequence)

Figure 13. Link Reset Timing

7.3.2. Codec Reset

A ‘Codec Reset’ is initiated via the Codec RESET command verb. It results in the target codec being reset to the default state. After the target codec completes its reset operation, an initialization sequence is requested.

7.3.3. Codec Initialization Sequence

- ❶ The codec drives SDI high at the last bit of SYNC to request a Codec Address (CAD) from the controller
- ❷ The codec will stop driving the SDI during this turnaround period
- ❸❹❺❻ The controller drives SDI to assign a CAD to the codec
- ❼ The controller releases the SDI after the CAD has been assigned
- ❽ Normal operation state

Figure 14. Codec Initialization Sequence

7.4. Verb and Response Format

7.4.1. Command Verb Format

There are two types of verbs: one with 4-Bit identifiers (4-Bit verbs) and 16-Bits of data, the other with 12-Bit identifiers (12-Bit verbs) and 8-Bits of data. Table 10 shows the 4-Bit verb structure of a command stream sent from the controller to operate the codec. Table 11 is the 12-Bit verb structure that gets and controls parameters in the codec.

Table 10. 40-Bit Commands in 4-Bit Verb Format

7.4.2. Response Format

There are two types of response from the codec to the controller. Solicited Responses are returned by the codec in response to a current command verb. The codec will send Solicited Response data in the next frame, without regard to the Set (Write) or Get (Read) command. The 32-Bit Response is interpreted by software, opaque to the controller.

Unsolicited Responses are sent by the codec independently of software requests. Jack Detection or GPI status information can be actively delivered to the controller and interpreted by software. The ‘Tag’ in Bit[31:28] is used to identify unsolicited events. This tag is undefined in the HDA specifications.

Table 12. Solicited Response Format

Bit [35]	Bit [34]	Bit [33:32]	Bit [31:0]

Table 13. Unsolicited Response Format

Bit [35]	Bit [34]	Bit [33:32]	Bit [31:28]	Bit [27:0]

Note: The response stream in the link protocol is 36-Bits wide. The response is placed in the lower 32-bit field. Bit-35 is a ‘Valid’ bit to indicate the response is ‘Ready’. Bit-34 is set to indicate that an unsolicited response was sent.

7.5. Power Management

All power management state changes in widgets are driven by software. Table 14 shows the System Power State Definitions.

In the ALC269, all the widgets include output/input converters support power control. Software may have various power states depending on system configuration.

Table 15 indicates those nodes that support power management. To simplify power control, software can configure whole codec power states through the audio function (NID=01h). Output converters (DACs) and input converters (ADCs) have no individual power control to supply fine-grained power control.

Table 14. System Power State Definitions

Power States	Definitions
D0	All power on. Individual DACs and ADCs can be powered up or down as required.
D1	All amplifiers and converters (DACs and ADCs) are powered down. State maintained, analog reference stays up.
D2	All amplifiers and converters (DACs and ADCs) are powered down. State maintained, but analog reference off (D1 + analog reference off).
D3 (Hot)	Power still supplied. The codec stops the internal clock. State is maintained.
D3 (Cold)	All power removed. State lost.

Condition	Description
LINK Response powered down	Internal clock is stopped. SDATA-IN and S/PDIF-OUT are floated with pulled low 47K resistors internally. Detection of 'Link Reset Entry' and 'Link Reset Exit' sequences are supported. All states are maintained if DVDD is supplied.
DAC powered down	Analog block and digital filter are powered down.
ADC powered down	Analog block and digital filter are powered down. The data on SDATA-IN is quiet.
Headphone Driver powered down	All headphone drivers are powered down.
Mixers powered down	All internal mixer widgets are powered down. The DC reference and VREFOUTx at individual pin complexes are still alive.
Reference power down	All internal references, DC reference, and VREFOUTx at individual pin complexes are off.

8. Supported Verbs and Parameters

This section describes the Verbs and Parameters supported by various widgets in the ALC269. If a verb is not supported by the addressed widget, it will respond with 32 bits of '0'.

8.1. Verb – Get Parameters (Verb ID=F00h)

The 'Get Parameters' verb is used to get system information and the function capabilities of the HDA codec. All the parameters are read-only. Refer to section 7.4.1 Command Verb Format, page 22, to get detailed information about supported parameters.

Table 17. Verb – Get Parameters (Verb ID=F00h)

Bit	Description
31:24	Reserved. Read as 0's.
23:20	MajRev. The major version number (in decimal) of the HDA Spec to which the ALC269 is fully compliant.
19:16	MinRev. The minor version number (in decimal) of the HDA Spec to which the ALC269 is fully compliant.
15:8	Revision ID. The vendor's revision number. 00h is for the first silicon version A, 01h is for the second version B, etc.
7:0	Stepping ID. The vendor's stepping number within the given Revision ID.

Note: The Root Node (NID=00h in the ALC269) supports this parameter.

For example, Revision ID=00h and Stepping ID=01h indicates the silicon is the A1 version.

8.1.3. Parameter – Subordinate Node Count (Verb ID=F00h, Parameter ID=04h)

For the root node, the Subordinate Node Count provides information about audio function group nodes associated with the root node. For function group nodes, it provides the total number of widgets associated with this function node.

0	PCM. 0: Not supported 1: Supported

Note: Input converters and output converters support this parameter.

8.1.9. Parameter – Pin Capabilities (Verb ID=F00h, Parameter ID=0Ch)

The Pin Capabilities parameter returns a bit field describing the capabilities of the Pin Complex widget.

Table 26. Parameter – Pin Capabilities (Verb ID=F00h, Parameter ID=0Ch)

Codec Response Format

Bit	Description														
31:16	Reserved. Read as 0's.

7	L-R Swap. Indicates the capability of swapping the left and rights.														
6	Balanced I/O Pin. ‘1’ indicates this pin complex has balanced pins.														
5	Input Capable. ‘1’ indicates this pin complex supports input.														
4	Output Capable. ‘1’ indicates this pin complex supports output.														
3	Headphone Drive Capable. ‘1’ indicates this pin complex has an amplifier to drive a headphone.														
2	Presence Detect Capable. ‘1’ indicates this pin complex can detect whether there is anything plugged in.														
1	Trigger Required. ‘1’ indicates whether a software trigger is required for an impedance measurement.														
0	Impedance Sense Capable. ‘1’ indicates this pin complex can perform analog sense on the attached device to determine its type.														

Note: Only Pin Complex widgets support this parameter.

8.1.10. Parameter – Amplifier Capabilities (Verb ID=F00h, Input Amplifier Parameter ID=0Dh)

Parameters in this node provide audio function group default information. Individual converters have their own parameters to provide amplifier capabilities if the ‘AMP Param Override’ bit is set.

Codec Response Format

Bit	Description
31	(Input) Mute Capable.
30:23	Reserved. Read as 0.
22:16	Step Size. Indicates the size of each step in the gain range. Each step may be 0~32dB, specified in 0.25dB steps. ‘0’ indicates a step of 0.25dB. ‘127’ indicates a step of 32dB.
15	Reserved. Read as 0.
14:8	Number of Steps. Indicates the number of steps in the gain range. ‘0’ means the gain is fixed.
7	Reserved. Read as 0.
6:0	Offset. Indicates which step is 0dB.

8.1.11. Parameter – Amplifier Capabilities (Verb ID=F00h, Output Amplifier Parameter ID=12h)

Parameters in this node provide audio function group default information. Individual converters have their own parameters to provide amplifier capabilities if the ‘AMP Param Override’ bit is set.

12	Set Right Amp. 1 indicates right amplifier gain will be set.
11:8	Index Offset (for input amplifiers on Sum widgets and Selector Widgets). 5 bits index offset in connection list is used to select which input gain will be set on a mixer or a multiplexer widget. The index is ignored if the node is not a mixer or a multiplexer widget, or the 'Set Input Amp' bit is not set.
7	Mute. 0: Unmute 1: Mute ($-\infty$ gain)
6:0	Gain[6:0]. A 7-bit step value specifying the amplifier gain.

9. Electrical Characteristics

9.1. DC Characteristics

9.1.1. Absolute Maximum Ratings

Table 76. Absolute Maximum Ratings

Parameter	Symbol	Minimum	Typical	Maximum	Units
Power Supplies					
Digital Power for Core	DVDD	3.0	3.3	3.6	V
Digital Power for Link* ¹	DVDD-IO	1.5	3.3	3.6	V
Analog Power* ²	AVDD1, AVDD2	3.3	5.0	5.25	V
BTL Analog Power* ^{2, *3}	PVDD1, PVDD2	3.3	5.0	5.25	V
Ambient Operating Temperature	Ta	0	-	+70	°C
Storage Temperature	Ts	-	-	+125	°C
ESD (Electrostatic Discharge)					
	Susceptibility Voltage				
All Pins Except PVDD1, PVDD2			4000V		
PVDD1 (Pin39), PVDD2 (Pin 46)			3500V		

Note1: DVDD-IO must be lower than DVDD.

Note2: PVDD must be greater than AVDD. Keep PVDD \geq AVDD+0.8V for best performance.

When (PVDD \geq AVDD + 1V), THD+N will be degraded when playing at full power output.

Note3: When the Class-D amplifier is operating, surges of PVDD > 7V duration for 0.1ms may damage the amplifier. To suppress such surges, 10 μ F tantalum capacitors are required at PVDD1 and PVDD2.

9.1.2. Threshold Voltage

DVDD-IO=3.3V \pm 5%, T_{ambient}=25°C, with 50pF external load.
